

Warm Up (11/13-11/14)

**** Take out your 10.2 Section Assessment to be stamped ****

- 1) In your own words, describe the difference between mitosis and meiosis.
- 2) What is DNA and why must DNA be replicated before a cell divides?

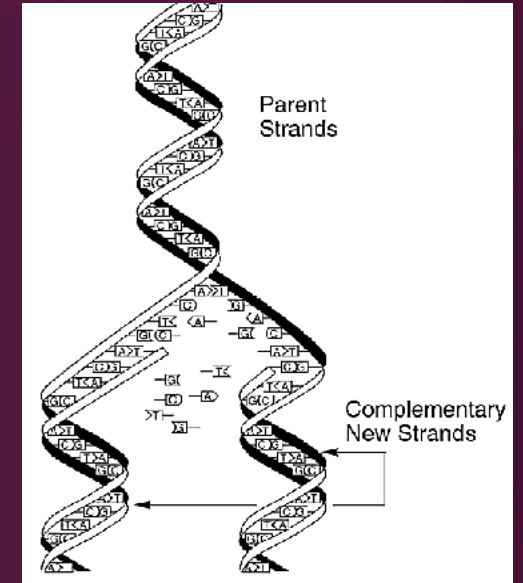

Agenda

- Warm up
- Review Ch 10 Quiz
- Pre- Assessment: DNA Kahoot
- 11.1 Notes: DNA- The Molecule of Heredity
- DNA replication cut & paste activity

Homework: 11.1 WKST (Due Thurs/Fri)

11.1: DNA-

The Molecule of Heredity

DNA

A DNA molecule coils up
to form a chromosome

How many chromosomes are found in a human cell?

Chromosomes/DNA contain your genes, and genes are what make your traits, like eye color

What is your Eye Color?
If you wear colored contact lenses, please choose your original eye color.

			
<input type="radio"/> Blue/Grey	<input type="radio"/> Green/Hazel	<input type="radio"/> Light Brown	<input type="radio"/> Dark Brown

What is your Earlobe Shape?

	
<input type="radio"/> Free	<input type="radio"/> Attached

11.1 DNA: The Molecule of Heredity

- DNA- Deoxyribonucleic acid
- Polymer= DNA; Monomer= nucleotides
- The Structure of DNA:
 - Double Helix (like a twisted ladder)
 - Made up of many nucleotides
 - Nucleotide= Phosphate group + Sugar + Nitrogenous base
 - Nitrogenous bases include Purines & Pyrimidines
 - Purine= Adenine (A), Guanine (G)- 2 ringed
 - Pyrimidine= Cytosine (C), Uracil (U) (for RNA only), Thymine (T) – 1 ringed

The Purines

Adenine

Guanine

The Pyrimidines

Cytosine

Thymine

Uracil

Deoxyribonucleic Acid (DNA)

DNA is like a twisted ladder
(Double Helix)

- Sides are phosphates and sugar
- Steps are the bases

DNA Structure

- Nitrogenous bases match up and bond (by Hydrogen bonds)
 - Think of DNA like a zipper
- A bonds with T
- C bonds with G
- Sides of DNA are arranged “anti- parallel”- numbering of carbons

<https://www.youtube.com/watch?v=L156Sbjs7zU>

- James Watson & Francis Crick are known for the contribution they made to the discovery of DNA's structure

<https://youtu.be/BIPolYrdirl>

Practice

Write the complimentary DNA strand for the following:

- CGTAAGCGCTAATTA

DNA Replication

- DNA must be copied so cells can divide (mitosis/ meiosis) and each copy receive a FULL set of DNA.
 - 1) Separation of strands (DNA unzips)
 - 2) Base pairing (ex: if free strand has Cytosine (C), Guanine (G) will pair with it)
 - 3) Bonding of bases (bases bond together as if glue were holding it together)

Each new DNA molecule

- Has one nucleotide strand from the original DNA molecule and one strand from free nucleotides in the cell.
- One strand is “old” and one is “new” = “Semi- conservative”

<https://www.youtube.com/watch?v=4jtmOZalvSo>

Semi-Conservative Replication
